

THE EQUIVARIANT BRAUER GROUPS OF COMMUTING FREE AND PROPER ACTIONS ARE ISOMORPHIC

ALEXANDER KUMJIAN, IAIN RAEBURN, AND
DANA P. WILLIAMS

1 September 1994

ABSTRACT. If X is a locally compact space which admits commuting free and proper actions of locally compact groups G and H , then the Brauer groups $\mathrm{Br}_H(G \backslash X)$ and $\mathrm{Br}_G(X/H)$ are naturally isomorphic.

Rieffel's formulation of Mackey's Imprimitivity Theorem asserts that if H is a closed subgroup of a locally compact group G , then the group C^* -algebra $C^*(H)$ is Morita equivalent to the crossed product $C_0(G/H) \rtimes G$. Subsequently, Rieffel found a symmetric version, involving two subgroups of G , and Green proved the following *Symmetric Imprimitivity Theorem*: if two locally compact groups act freely and properly on a locally compact space X , G on the left and H on the right, then the crossed products $C_0(G \backslash X) \rtimes H$ and $C_0(X/H) \rtimes G$ are Morita equivalent. (For a discussion and proofs of these results, see [15].) Here we shall show that in this situation there is an isomorphism $\mathrm{Br}_H(G \backslash X) \cong \mathrm{Br}_G(X/H)$ of the equivariant Brauer groups introduced in [2].

Suppose (G, X) is a second countable locally compact transformation group. The objects in the underlying set $\mathfrak{Br}_G(X)$ of the equivariant Brauer group $\mathrm{Br}_G(X)$ are dynamical systems (A, G, α) , in which A is a separable continuous-trace C^* -algebra with spectrum X , and $\alpha : G \rightarrow \mathrm{Aut}(A)$ is a strongly continuous action of G on A inducing the given action of G on X . The equivalence relation on such systems is the equivariant Morita equivalence studied in [1], [3]. The group operation is given by $[A, \alpha] \cdot [B, \beta] = [A \otimes_{C(X)} B, \alpha \otimes \beta]$, the inverse of $[A, \alpha]$ is the conjugate system $[\overline{A}, \overline{\alpha}]$, and the identity is represented by $(C_0(X), \tau)$, where $\tau_s(f)(x) = f(s^{-1} \cdot x)$.

Notation. Suppose that H is a locally compact group, that X is a free and proper right H -space, and that (B, H, β) a dynamical system. Then $\mathrm{Ind}_H^X(B, \beta)$ will be the

C^* -algebra (denoted by $GC(X, B)^\alpha$ in [13] and by $\text{Ind}(B; X, H, \beta)$ in [11]) of bounded continuous functions $f : X \rightarrow B$ such that $\beta_h(f(x \cdot h)) = f(x)$, and $x \cdot H \mapsto \|f(x)\|$ belongs to $C_0(X/H)$.

We now state our main theorem.

Theorem 1. *Let X be a second countable locally compact Hausdorff space, and let G and H be second countable locally compact groups. Suppose that X admits a free and proper left G -action, and a free and proper right H -action such that $(g \cdot x) \cdot h = g \cdot (x \cdot h)$ for all $x \in X$, $g \in G$, and $h \in H$. Then there is an isomorphism Θ of $\text{Br}_H(G \backslash X)$ onto $\text{Br}_G(X/H)$ satisfying:*

- (1) *if (A, α) represents $\Theta[B, \beta]$, then $A \rtimes_\alpha G$ is Morita equivalent to $B \rtimes_\beta H$;*
- (2) *$\Theta[B, \beta]$ is realised by the pair $(\text{Ind}_H^X(B, \beta)/J, \tau \otimes \text{id})$ in $\mathfrak{Br}_G(X/H)$, where $\tau \otimes \text{id}$ denotes left translation and, if $\pi_{G \cdot x}$ is the element of $\widehat{B} = G \backslash X$ corresponding to $G \cdot x$,*

$$J = \{f \in \text{Ind}_H^X(B, \beta) : \pi_{G \cdot x}(f(x)) = 0 \text{ for all } x \in X\}.$$

Item (1) is itself a generalization of Green's symmetric imprimitivity theorem, and our proof of Theorem 1 follows the approach to Green's theorem taken in [3]: prove that both $C_0(G \backslash X) \rtimes H$ and $C_0(X/H) \rtimes G$ are Morita equivalent to $C_0(X) \rtimes_\alpha (G \times H)$, where $\alpha_{s,h}(f)(x) = f(s^{-1} \cdot x \cdot h)$, by noting that the Morita equivalences of $C_0(X) \rtimes G$ with $C_0(G \backslash X)$ and $C_0(X) \rtimes H$ with $C_0(X/H)$ ([7], [15, Situation 10]) are equivariant, and hence induce Morita equivalences

$$\begin{aligned} C_0(G \backslash X) \rtimes H &\sim (C_0(X) \rtimes G) \rtimes H \cong C_0(X) \rtimes (G \times H) \\ &\cong (C_0(X) \rtimes H) \rtimes G \sim C_0(X/H) \rtimes G. \end{aligned}$$

The same symmetry considerations show that it will be enough to prove that $\text{Br}_H(G \backslash X) \cong \text{Br}_{G \times H}(X)$. Since we already know that $\text{Br}(G \backslash X) \cong \text{Br}_G(X)$ [2, §6.2], we just have to check that this isomorphism is compatible with the actions of H .

Suppose G acts freely and properly on X , and $p : X \rightarrow G \backslash X$ is the orbit map. If B is a C^* -algebra with a nondegenerate action of $C_0(G \backslash X)$, then the pull-back p^*B is the quotient of $C_0(X) \otimes B$ by the balancing ideal

$$I_{G \backslash X} = \overline{\text{span}}\{f \cdot \phi \otimes b - \phi \otimes f \cdot b : \phi \in C_0(X), f \in C_0(G \backslash X), b \in B\}$$

in other words, $p^*B = C_0(X) \otimes_{C(G \backslash X)} B$. The nondegenerate action of $C_0(G \backslash X)$ on B induces a continuous map q of \widehat{B} onto $G \backslash X$, characterized by $\pi(f \cdot b) = f(q(\pi))\pi(b)$. Then under the natural identification of $C_0(X) \otimes B$ with $C_0(X, B)$,

$$I_{G \backslash X} \cong \{f \in C_0(X, B) : \pi(f(x)) = 0 \text{ for all } x \in q(\pi)\},$$

so that p^*B has spectrum

$$\widehat{p^*B} = \{(x, \pi) \in X \times \widehat{B} : G \cdot x = q(\pi)\}.$$

If B is a continuous-trace algebra with spectrum $G \backslash X$, then p^*B is a continuous-trace algebra with spectrum X .

The isomorphism $\Theta : \text{Br}(G \backslash X) \cong \text{Br}_G(X)$ is given by $\Theta[A] = [p^*A, \tau \otimes \text{id}]$. To prove Θ is surjective in [2], we used [12, Theorem 1.1], which implies that if $(B, \beta) \in \mathfrak{Br}_G(X)$, then $B \rtimes_\beta G$ is a continuous-trace algebra with spectrum $G \backslash X$ such that (B, β) is Morita equivalent to $(p^*(B \rtimes_\beta G), \tau \otimes \text{id})$, and hence that $[B, \beta] = \Theta[B \rtimes_\beta G, \text{id}]$. In obtaining the required equivariant version of [12, Theorem 1.1], we have both simplified the proof and mildly strengthened the conclusion (see Corollary 4 below). However, with all these different group actions around, the notation could get messy, and we pause to establish some conventions.

Notation. We shall be dealing with several spaces carrying a left action of G and/or a right action of H . We denote by τ the action of G by left translation on $C_0(G)$, $C_0(X)$ or $C_0(G \backslash X)$, and by σ any action of H by right translation; we shall also use σ^G to denote the action of G by right translation on $C_0(G)$. Restricting an action β of $G \times H$ on an algebra A gives actions $\alpha : G \rightarrow \text{Aut}(A)$, $\gamma : H \rightarrow \text{Aut}(A)$ such that

$$(1) \quad \alpha_s(\gamma_h(a)) = \gamma_h(\alpha_s(a)) \quad \text{for all } h \in H, s \in G, a \in A.$$

Conversely, two actions α, γ satisfying (1) define an action of $G \times H$ on A , which we denote by $\alpha\gamma$; we write γ for $\text{id} \gamma$ since it will be clear from context whether an action of H or of $G \times H$ is called for. If $\Phi : (A, G, \alpha) \rightarrow (B, G, \beta)$ is an equivariant isomorphism (i.e. $\Phi(\alpha_s(a)) = \beta_s(\Phi(a))$), then we denote by $\Phi \rtimes \text{id}$ the induced isomorphism of $A \rtimes_\alpha G$ onto $B \rtimes_\beta G$. Similarly, if α and γ satisfy (1), we write $\alpha \rtimes \text{id}$ for the induced action of G on $A \rtimes_\gamma H$.

Lemma 2. *Suppose a locally compact group G acts freely and properly on a locally compact space X , and that A is a C^* -algebra carrying a non-degenerate action of $C_0(X)$. If $\alpha : G \rightarrow \text{Aut}(A)$ is an action of G on A satisfying $\alpha_s(\phi \cdot a) = \tau_s(\phi) \cdot \alpha_s(a)$, then the map sending $f \otimes a$ in $C_0(X) \otimes A$ to the function $s \mapsto f \cdot \alpha_s^{-1}(a)$ induces an equivariant isomorphism Φ of $(C_0(X) \otimes_{C(G \backslash X)} A, G, \text{id} \otimes \alpha)$ onto $(C_0(G, A), G, \tau \otimes \text{id})$.*

Remark 3. For motivation, consider the case where $A = C_0(X)$. Then the map $\Psi : C_b(X \times X) \rightarrow C_b(G \times X)$ defined by $\Psi(f)(s, x) = f(x, s \cdot x)$ maps C_0 to C_0 precisely when the action is proper, has range which separates the points of $G \times X$ precisely when the action is free, and has kernel consisting of the functions which vanish on the closed subset $\Delta = \{(x, y) : G \cdot x = G \cdot y\}$. Thus the free and proper actions are precisely those for which Ψ induces an isomorphism of $C_0(X) \otimes_{C(G \backslash X)} C_0(X)$ onto $C_0(G) \otimes C_0(X)$.

Proof of Lemma 2. If $\phi \in C_0(G \backslash X)$, then $f \cdot \phi \otimes a$ and $f \otimes \phi \cdot a$ have the same image in $C_0(G, A)$, and the map factors through the balanced tensor product as claimed. Further, Φ is related to the map Ψ in Remark 3 by

$$(2) \quad \Phi(f \otimes g \cdot a) = (\Psi(f \otimes g)(s, \cdot)) \cdot \alpha_s^{-1}(a).$$

Thus it follows from the remark that (2) defines an element of $C_0(G, A)$ and that the closure of the range of Φ contains all functions of the form $s \mapsto \xi(s)f \cdot \alpha_s^{-1}(a)$ for $\xi \in C_c(G)$, $f \in C_c(X)$, and $a \in A$. These elements span a dense subset of $C_0(G, A)$, and hence Φ is surjective. The nondegenerate action of $C_0(X)$ on A induces a continuous equivariant map q of \widehat{A} onto X such that $\pi(f \cdot a) = f(q(\pi))\pi(a)$, and the balanced tensor product $C_0(X) \otimes_{C(G \setminus X)} A$ has spectrum $\Delta = \{(x, \pi) : G \cdot x = G \cdot q(\pi)\}$. Since each representation $(q(\pi), s \cdot \pi) = (q(\pi), \pi \circ \alpha_s^{-1})$ in Δ factors through Φ and the representation $b \mapsto \pi(b(s))$ of $C_0(G, A)$, the homomorphism Φ is also injective. Finally, to see the equivariance, we compute:

$$\Phi(\text{id} \otimes \alpha_s(h \otimes a))(t) = h \cdot \alpha_t^{-1}(\alpha_s(a)) = \Phi(h \otimes a)(s^{-1}t) = \tau_s \otimes \text{id}(\Phi(h \otimes a))(t). \quad \square$$

Corollary 4. (cf. [12, Theorem 1.1]) *Let (G, X) and $\alpha : G \rightarrow \text{Aut}(A)$ be as in Lemma 2. Then there is an equivariant isomorphism of $(p^*(A \rtimes_\alpha G), G, p^* \text{id})$ onto $(A \otimes \mathcal{K}(L^2(G)), G, \alpha \otimes \text{Ad } \rho)$.*

Proof. A routine calculation shows that the equivariant isomorphism Φ of Lemma 2 gives an equivariant isomorphism

$$(3) \quad \begin{aligned} \Phi \rtimes \text{id} : ((C_0(X) \otimes_{C(G \setminus X)} A) \rtimes_{\text{id} \otimes \alpha} G, (\tau \otimes \text{id}) \rtimes \text{id}) \\ \rightarrow (C_0(G, A) \rtimes_{\tau \otimes \text{id}} G, (\sigma^G \otimes \alpha) \rtimes \text{id}). \end{aligned}$$

We also have equivariant isomorphisms

$$(4) \quad \begin{aligned} (C_0(G, A) \rtimes_{\tau \otimes \text{id}} G, (\sigma^G \otimes \alpha) \rtimes \text{id}) &\cong (A \otimes (C_0(G) \rtimes_\tau G), \alpha \otimes (\sigma^G \rtimes \text{id})), \\ &\cong (A \otimes \mathcal{K}(L^2(G)), \alpha \otimes \text{Ad } \rho) \end{aligned}$$

and

$$(5) \quad (C_0(X) \otimes_{C(G \setminus X)} (A \rtimes_\alpha G), \tau \otimes \text{id}) \cong ((C_0(X) \otimes_{C(G \setminus X)} A) \rtimes_{\text{id} \otimes \alpha} G, (\tau \otimes \text{id}) \rtimes \text{id});$$

combining (3), (4), and (5) gives the result. \square

Lemma 5. *In addition to the hypotheses of Lemma 2, suppose that H is a locally compact group acting on the right of X , and that (A, H, γ) is a dynamical system such that α and γ commute and $\gamma_h(f \cdot a) = \sigma_h(f) \cdot \gamma_h(a)$ for $h \in H$, $f \in C_0(X)$, $a \in A$. Then the action $\tau\sigma \otimes \gamma$ of $G \times H$ on $C_0(X) \otimes A$ preserves the balancing ideal $I_{G \setminus X}$, and hence induces an action of $G \times H$ on $C_0(X) \otimes_{C(G \setminus X)} A$, also denoted $\tau\sigma \otimes \gamma$. The equivariant isomorphism of Lemma 2 induces an equivariant isomorphism*

$$((C_0(X) \otimes_{C(G \setminus X)} A) \rtimes_{\text{id} \otimes \alpha} G, (\tau\sigma \otimes \gamma) \rtimes \text{id}) \cong (C_0(G, A) \rtimes_{\tau \otimes \text{id}} G, (\sigma^G \otimes \alpha\gamma) \rtimes \text{id}).$$

Proof. The first assertion is straightforward. For the second, we can consider the actions of H and G separately. We have already observed in (3) that $\Phi \rtimes \text{id}$ intertwines the G -actions. On the other hand, if $h \in H$ and $t \in G$, then

$$\begin{aligned} \Phi(\sigma_h \otimes \gamma_h(f \otimes a))(t) &= \sigma_h(f) \cdot \alpha_t^{-1}(\gamma_h(a)) = \sigma_h(f) \cdot \gamma_h(\alpha_t^{-1}(a)) \\ &= \gamma_h(\Phi(f \otimes a)(t)). \quad \square \end{aligned}$$

Corollary 6. *Let ${}_G X_H$ and $\alpha : G \rightarrow \text{Aut}(A)$, $\gamma : H \rightarrow \text{Aut}(A)$ be as in the lemma. Denote by p the orbit map of X onto $G \backslash X$. Then there is an equivariant isomorphism*

$$(p^*(A \rtimes_\alpha G), G \times H, \tau\sigma \otimes (\gamma \rtimes \text{id})) \cong (A \otimes \mathcal{K}(L^2(G)), G \times H, \alpha\gamma \otimes \text{Ad } \rho).$$

Proof. Compose the isomorphism of Lemma 5 with (4) and (5). \square

We are now ready to define our map of $\text{Br}_H(G \backslash X)$ into $\text{Br}_{G \times H}(X)$. Suppose $(B, \beta) \in \mathfrak{Br}_H(X)$. Then the action $\tau\sigma \otimes \beta$ of $G \times H$ preserves the balancing ideal $I_{G \backslash X}$: if $\phi \in C_0(G \backslash X)$ then

$$\begin{aligned} (\tau\sigma \otimes \beta)_{s,h}(f \cdot \phi \otimes b - f \otimes \phi \cdot b) &= \sigma_h(\tau_s(f \cdot \phi)) \otimes \beta_h(b) - \sigma_h(\tau_s(f)) \otimes \beta_h(\phi \cdot b) \\ &= \sigma_h(\tau_s(f)) \cdot \sigma_h(\phi) \otimes \beta_h(b) - \sigma_h(\tau_s(f)) \otimes \sigma_h(\phi) \cdot \beta_h(b). \end{aligned}$$

Since $p^*(B)$ is a continuous-trace C^* -algebra with spectrum X [12, Lemma 1.2], and $\tau\sigma \otimes \beta$ covers the canonical $G \times H$ -action on X , we can define $\theta : \mathfrak{Br}_H(G \backslash X) \rightarrow \mathfrak{Br}_{G \times H}(X)$ by $\theta(B, \beta) = (p^*(B), \tau\sigma \otimes \beta)$.

Similarly if $(A, \alpha\gamma) \in \mathfrak{Br}_{G \times H}(X)$, then $A \rtimes_\alpha G$ is a continuous-trace C^* -algebra with spectrum $G \backslash X$ by [12, Theorem 1.1]. Since γ is compatible with σ , we have $\gamma_h(\phi \cdot z(s)) = \sigma_h(\phi) \cdot \gamma_h(z(s))$ for $z \in C_c(G, A)$, and hence $\gamma \rtimes \text{id}$ covers the given action of H on X . Thus we can define $\lambda : \mathfrak{Br}_{G \times H}(X) \rightarrow \mathfrak{Br}_H(G \backslash X)$ by $\lambda(A, \alpha\gamma) = (A \rtimes_\alpha G, \gamma \rtimes \text{id})$.

Proposition 7. *Let X be a second countable locally compact Hausdorff space, and let G and H be second countable locally compact groups. Suppose that X admits a free and proper left G -action, and an H -action such that $(g \cdot x) \cdot h = g \cdot (x \cdot h)$ for all $x \in X$, $g \in G$, and $h \in H$. Then θ and λ above preserve Morita equivalence classes, and define homomorphisms $\Theta : \mathfrak{Br}_H(G \backslash X) \rightarrow \mathfrak{Br}_{G \times H}(X)$ and $\Lambda : \mathfrak{Br}_{G \times H}(X) \rightarrow \mathfrak{Br}_H(G \backslash X)$. In fact, Θ is an isomorphism with inverse Λ , and if $\Theta[B, \beta] = [A, \alpha]$, then $B \rtimes_\beta H$ is Morita equivalent to $A \rtimes_\alpha (G \times H)$.*

Proof. If (\mathcal{Y}, v) implements an equivalence between (B, β) and (B', β') in $\mathfrak{Br}_H(G \backslash X)$, then, the external tensor product $\mathcal{Z} = C_0(X) \widehat{\otimes} \mathcal{Y}$, as defined in [9, §1.2] or [2, §2], is a $C_0(X) \otimes B - C_0(X) \otimes B'$ -imprimitivity bimodule. A routine argument, similar to that in [2, Lemma 2.1], shows that the Rieffel correspondence [14, Theorem 3.1] between the lattices of ideals in $C_0(X) \otimes B$ and in $C_0(X) \otimes B'$ maps the balancing ideal $I = I_{C(G \backslash X)}$ in $C_0(X) \otimes B$ to the balancing ideal $J = J_{C(G \backslash X)}$ in $C_0(X) \otimes B'$. Thus [14, Corollary 3.2] implies that $\mathcal{X} = \mathcal{Z}/\mathcal{Z} \cdot J$ is a $p^*(B) - p^*(B')$ -imprimitivity

bimodule. Since $f \cdot x = x \cdot f$ for all $x \in \mathcal{X}$ and $f \in C_0(X)$, it follows from [10, Proposition 1.11] that \mathcal{X} implements a Morita equivalence over X . More tedious but routine calculations show that the map defined on elementary tensors in $\mathcal{Z}_0 = C_0(X) \odot \mathcal{Y}$ by $u_{(s,h)}^o(f \otimes y) = \sigma_h(\tau_s(f)) \otimes v_h(y)$ extends to the completion \mathcal{Z} , and defines a strongly continuous map $u : G \times H \rightarrow \text{Iso}(\mathcal{X})$ such that (\mathcal{X}, u) implements an equivalence between $(p^*(B), \tau\sigma \otimes \beta)$ and $(p^*(B'), \tau\sigma \otimes \beta')$. Thus Θ is well-defined.

Observe that

$$\begin{aligned} \Theta([B, \beta][B', \beta']) &= \Theta([B \otimes_{C(G \setminus X)} B', \beta \otimes \beta']) \\ (6) \qquad \qquad \qquad &= [p^*(B \otimes_{C(G \setminus X)} B'), \tau\sigma \otimes (\beta \otimes \beta')]. \end{aligned}$$

But (6) is the class of

$$\begin{aligned} &(C_0(X) \otimes_{C(G \setminus X)} B \otimes_{C(G \setminus X)} B', \tau\sigma \otimes \beta \otimes \beta') \\ &\sim (C_0(X) \otimes_{C(X)} C_0(X) \otimes_{C(G \setminus X)} B \otimes_{C(G \setminus X)} B', \tau\sigma \otimes \tau\sigma \otimes \beta \otimes \beta') \\ &\sim (C_0(X) \otimes_{C(G \setminus X)} B \otimes_{C(X)} C_0(X) \otimes_{C(G \setminus X)} B', \tau\sigma \otimes \beta \otimes \tau\sigma \otimes \beta'), \end{aligned}$$

which represents the product of $\Theta[B, \beta]$ and $\Theta[B', \beta']$. Thus Θ is a homomorphism.

Now suppose that $(A, \alpha\gamma) \sim (A', \alpha'\gamma')$ in $\mathfrak{Br}_{G \times H}(X)$ via (\mathcal{Z}, w) . Then $u_s = w_{(s,e)}$ and $v_h = w_{(e,h)}$ define actions of G and H , respectively, on \mathcal{Z} . In particular, (\mathcal{Z}, u) implements an equivalence between (A, α) and (A', α') in $\mathfrak{Br}_G(X)$. It follows from [1, §6] that $\mathcal{Y}_0 = C_c(G, \mathcal{Z})$ can be completed to a $A \rtimes_\alpha G - A' \rtimes_{\alpha'} G$ -imprimitivity bimodule \mathcal{Y} . One can verify that the induced $C_0(G \setminus X)$ -actions on \mathcal{Y}_0 are given by $(\phi \cdot x)(t) = \phi \cdot (x(t))$ and $(x \cdot \phi)(t) = (x(t)) \cdot \phi$, and [10, Proposition 1.11] implies that \mathcal{Y} is an imprimitivity bimodule over $G \setminus X$. Now define \tilde{v}_h^o on \mathcal{Y}_0 by $\tilde{v}_h^o(x)(t) = v_h(x(t))$. Using the inner products defined in [1, §6],

$$\begin{aligned} {}_{A \rtimes_\alpha G} \langle \tilde{v}_h^o(x), \tilde{v}_h^o(y) \rangle(t) &= \int_G \langle \tilde{v}_h^o(x)(s), \Delta(t^{-1}s)u_t(\tilde{v}_h^o(y)(t^{-1}s)) \rangle ds \\ &= \int_G \langle v_h(x(s)), \Delta(t^{-1}s)u_t(v_h(y(t^{-1}s))) \rangle ds \\ &= \gamma_h({}_{A \rtimes_\alpha G} \langle x, y \rangle(t)), \end{aligned}$$

where, in the last equality, we use $u_s \circ v_h = v_h \circ u_s$. A similar computation shows that $\langle \tilde{v}_h^o(x), \tilde{v}_h^o(y) \rangle_{{}_{A' \rtimes_{\alpha'} G}}(t) = \gamma'_h(\langle x, y \rangle_{{}_{A' \rtimes_{\alpha'} G}}(t))$. Thus \tilde{v}_h^o extends to all of \mathcal{Y} and defines a map $\tilde{v} : H \rightarrow \text{Iso}(\mathcal{Y})$, and it is not hard to verify that \tilde{v} is strongly continuous. Therefore $(A \rtimes_\alpha G, \gamma \rtimes \text{id}) \sim (A' \rtimes_{\alpha'} G, \gamma' \rtimes \text{id})$ in $\mathfrak{Br}_{G \times H}(X)$, and Λ is well-defined.

Now it will suffice to show that, for $\mathfrak{a} \in \mathfrak{Br}_H(G \setminus X)$ and $\mathfrak{b} \in \mathfrak{Br}_{G \times H}(X)$, $\theta(\lambda(\mathfrak{b})) \sim \mathfrak{b}$ and $\lambda(\theta(\mathfrak{a})) \sim \mathfrak{a}$. For the first of these, suppose that $(A, \alpha\gamma) \in \mathfrak{Br}_{G \times H}(X)$. Then $\theta(\lambda(A, \alpha\gamma)) = (p^*(A \rtimes_\alpha G), (\tau\sigma \otimes \gamma) \rtimes \text{id})$, which by Corollary 6 is equivalent to

$(A \otimes \mathcal{K}(L^2(G)), \alpha\gamma \otimes \text{Ad } \rho)$, and hence to $(A, \alpha\gamma)$. For the other direction, suppose that $(B, \beta) \in \mathfrak{Br}_H(G \setminus X)$. Then $\lambda(\theta(B, \beta)) = (p^*B \rtimes_{\tau \otimes \text{id}} G, (\sigma \otimes \beta) \rtimes \text{id})$. Now

$$p^*B \rtimes_{\tau \otimes \text{id}} G \cong (C_0(X) \otimes_{C(G \setminus X)} B) \rtimes_{\tau \otimes \text{id}} G \cong (C_0(X) \rtimes_{\tau} G) \otimes_{C(G \setminus X)} B,$$

which is Morita equivalent to $C_0(G \setminus X) \otimes_{C(G \setminus X)} B \cong B$. Because the Morita equivalence of $C_0(X) \rtimes G$ with $C_0(G \setminus X)$ is H -equivariant [3], it follows that

$$\lambda(\theta(B, \beta)) = (p^*B \rtimes_{\tau \otimes \text{id}} G, (\sigma \otimes \beta) \rtimes \text{id}) \sim (C_0(G \setminus X) \otimes_{C(G \setminus X)} B, \sigma \otimes \beta) \cong (B, \beta).$$

This shows that $\Lambda \circ \Theta$ is the identity, and also implies that

$$p^*B \rtimes_{\tau \otimes \beta} (G \times H) \cong (p^*B \rtimes_{\tau \otimes \text{id}} G) \rtimes_{\sigma \otimes \beta} H \cong B \rtimes_{\beta} H,$$

which proves the last assertion. \square

Remark 8. We showed that Λ is a well-defined map of $\text{Br}_{G \times H}(X)$ into $\text{Br}_H(G \setminus X)$, and that it is a set-theoretic inverse for Θ ; since Θ is a group homomorphism, it follows that Λ is also a homomorphism. This seems to be non-trivial: it implies that if $(A, \alpha), (B, \beta)$ are in $\mathfrak{Br}_G(X)$, then $(A \otimes_{C(X)} B) \rtimes_{\alpha \otimes \beta} G$ is Morita equivalent to $(A \rtimes_{\alpha} G) \otimes_{C(G \setminus X)} (B \rtimes_{\beta} G)$. We do not know what general mechanism is at work here. Certainly, it is a Morita equivalence rather than an isomorphism: if G is finite and the algebra commutative, one algebra is $|G|$ -homogeneous and the other $|G|^2$ -homogeneous. The only direct way we have found uses [8, Theorem 17], which seems an excessively heavy sledgehammer.

Proof of Theorem 1. It follows from Proposition 7 that there are isomorphisms $\Theta_H : \text{Br}_H(G \setminus X) \rightarrow \text{Br}_{G \times H}(X)$, and $\Lambda_G : \text{Br}_{G \times H}(X) \rightarrow \text{Br}_G(X/H)$. Therefore $\Lambda_G \circ \Theta_H$ is an isomorphism of $\text{Br}_H(G \setminus X)$ onto $\text{Br}_G(X/H)$. Assertion (1) also follows from Proposition 7. The isomorphism $\Lambda_G \circ \Theta_H$ maps the class of (B, β) in $\mathfrak{Br}_H(G \setminus X)$ to the class of $(p^*(B) \rtimes_{\sigma \otimes \beta} H, (\tau \otimes \text{id}) \rtimes \text{id})$, so it remains to show that the latter is equivalent to $(A/J, \tau)$.

For convenience, write I for the balancing ideal $I_{C(G \setminus X)}$ in $C_0(X) \otimes B$. Then

$$p^*(B) \rtimes_{\sigma \otimes \beta} H = ((C_0(X) \otimes B)/I) \rtimes_{\sigma \otimes \beta} H = (C_0(X, B) \rtimes_{\sigma \otimes \beta} H)/(I \rtimes_{\sigma \otimes \beta} H)$$

by, for example, [8, Proposition 12]. By [13, Theorem 2.2], $\mathcal{X}_0 = C_c(X, B)$ can be completed to a $C_0(X, B) \rtimes_{\sigma \otimes \beta} H$ - A -imprimitivity bimodule \mathcal{X} . The irreducible representations of A are given by $M_{(x, \pi_{G \cdot y})}(f)(x) = \pi_{G \cdot y}(f(x))$ [13, Lemma 2.6]. In the proof of [13, Theorem 2.5], it was shown that the representation $\mathcal{X}^{M_{(x, \pi_{G \cdot y})}}$ of $C_0(X, B) \rtimes_{\sigma \otimes \beta} H$ induced from $M_{(x, \pi_{G \cdot y})}$ via \mathcal{X} is equivalent to $\text{Ind}_{\{e\}}^G N_{(x, G \cdot y)}$, where $N_{(x, G \cdot y)}$ is the analogous irreducible representation of $C_0(X, B)$. Since the orbit space for a proper action is Hausdorff, [5] implies that $(C_0(X, B), H, \sigma \otimes \beta)$ is regular. Since $R = \bigoplus_{x \in X} N_{(x, G \cdot x)}$ is a faithful representation of $p^*(B)$, it follows from [8, Theorem 24] that $\text{Ind}_{\{e\}}^G(R)$ is a faithful representation of $p^*(B) \rtimes_{\sigma \otimes \beta} H$, and so has

kernel $I \rtimes_{\sigma \otimes \beta} H$. On the other hand, $\text{Ind}_{\{e\}}^G(R)$ is equivalent to $\bigoplus_{x \in X} \mathcal{X}^{M(x, G \cdot x)}$. It follows from [14, §3] that ${}^I\mathcal{X} = \mathcal{X}/I \cdot \mathcal{X}$ is an $p^*(B) \rtimes_{\sigma \otimes \beta} H$ - X/H - A/J -imprimitivity bimodule. Then the map $u_s^o : \mathcal{X}_0 \rightarrow \mathcal{X}_0$ defined by $u_s^o(\xi)(x) = \xi(s^{-1} \cdot x)$ induces a map $u : G \rightarrow \text{Iso}({}^I\mathcal{X})$ such that $({}^I\mathcal{X}, u)$ implements the desired equivalence. \square

We close with two interesting special cases where the isomorphism takes a particularly elegant form. Recall that if B is a continuous-trace C^* -algebra with spectrum X , then we may view B as the sections $\Gamma_0(\xi)$ of a C^* -bundle ξ vanishing at infinity.

Corollary 9. *Suppose that H is a closed subgroup of a second countable locally compact group G , and that X is a second countable locally compact right H -space. Then $G \times X$ is a free and proper H -space via the diagonal action $(s, x) \cdot h = (sh, x \cdot h)$. Thus $(G \times X)/H$ is a locally compact G -space via $s \cdot [r, x] = [sr, x]$, and the map $(B, \beta) \mapsto (\text{Ind}_H^G(B, \beta), \tau)$ induces an isomorphism of $\text{Br}_H(X)$ onto $\text{Br}_G((X \times G)/H)$.*

Proof. We apply Theorem 1 to ${}_G(G \times X)_H$, where G acts on the left of the first factor, obtaining an isomorphism of $\text{Br}_H(X) \cong \text{Br}_H(G \backslash (G \times X))$ onto $\text{Br}_G((G \times X)/H)$ sending the class of (B, β) to the class of $\text{Ind}_H^{G \times X}(B, \beta)/J$ where $J = \{f : f(s, x)(x) = 0\}$.

Given $f \in \text{Ind}_H^{G \times X}(B, \beta)$ and $s \in G$, let $\Phi(f)(s)$ be the function from X to ξ defined by $\Phi(f)(s)(x) = f(s, x)(x)$. We claim $\Phi(f)(s) \in \Gamma_0(\xi)$. If $x_0 \in X$, then $x \mapsto f(s, x_0)(x)$ is in $\Gamma_0(\xi)$, and $\|\Phi(f)(s)(x) - f(s, x_0)(x)\|$ tends to zero as $x \rightarrow x_0$. It follows from [6, Proposition 1.6 (Corollary 1)] that $\Phi(f)(s)$ is continuous. To see that $\Phi(f)(s)$ vanishes at infinity, suppose that $\{x_n\} \subset X$ satisfies

$$\|\Phi(f)(s)(x_n)\| \geq \epsilon > 0$$

for all n . Then $\|f(s, x_n)\| \geq \epsilon$ for all n , and passing to a subsequence and relabeling if necessary, there must be $h_n \in H$ such that $(s \cdot h_n, x_n \cdot h_n) \rightarrow (r, x)$. Then $h_n \rightarrow s^{-1}r \in H$, and $x_n \rightarrow x \cdot (r^{-1}s)$. In sum, $\Phi(f)(s) \in \Gamma_0(\xi) = B$. Now the continuity of f easily implies that $s \mapsto \Phi(f)(s)$ is continuous from G to B . Furthermore, since β covers σ (i.e., $\beta_h(\phi \cdot b)(x) = \phi(x \cdot h)\beta_h(b)(x)$),

$$f(rh, x)(x) = \beta_h^{-1}(\Phi(f)(r))(x),$$

and Φ is a $*$ -homomorphism of $\text{Ind}_H^{G \times X}(B, \beta)$ into $\text{Ind}_H^G(B, \beta)$, which clearly has kernel J .

Finally, it is not difficult (cf., e.g., [13, Lemma 2.6]) to see that $\Phi(\text{Ind}_H^{G \times X}(B, \beta))$ is a rich subalgebra of $\text{Ind}_H^G(B, \beta)$ as defined in [4, Definition 11.1.1]. Thus Φ is surjective by [4, Lemma 11.1.4]. \square

Corollary 10. *Suppose that X is a locally compact left G -space, and that H is a closed normal subgroup of G which acts freely and properly on X . Then there is an isomorphism of $\text{Br}_{G/H}(H \backslash X)$ onto $\text{Br}_G(X)$ taking $[B, \beta]$ to $[p^*(B), p^*(\beta)] = [p^*(B), \tau \otimes \beta]$.*

Proof. View $Y = X \times G/H$ as a left G -space via the diagonal action, and a right G/H -space via right translation on the second factor. Both actions are free, and the second action is proper. To see that the first action is proper, suppose that $(x_n, t_n H) \rightarrow (x, tH)$ while $(s_n \cdot x_n, s_n t_n H) \rightarrow (y, rH)$. Then $s_n H \rightarrow sH$ for some $s \in G$. Passing to a subsequence and relabeling, we can assume that there are $h_n \in H$ such that $h_n s_n \rightarrow s$ in G . But then $s_n \cdot x_n \rightarrow y$ while $h_n \cdot (s_n \cdot x_n) \rightarrow s \cdot x$. Since the H -action is proper, we can assume that $h_n \rightarrow h$ in H . Thus $s_n \rightarrow h^{-1}s$, and this proves the claim.

The map $G \cdot (x, tH) \mapsto Ht^{-1} \cdot x$ is a bijection ϕ of $G \backslash Y$ onto $H \backslash X$. Further, $G \backslash Y$ is a right G/H -space and $H \backslash X$ is a left G/H -space with

$$\phi(v \cdot (s^{-1}H)) = sH \cdot \phi(v).$$

(That is, ϕ is equivariant when the G/H -action on $G \backslash Y$ is viewed as a left-action.) Therefore,

$$(7) \quad \text{Br}_{G/H}(G \backslash Y) \cong \text{Br}_{G/H}(H \backslash X)$$

Similarly, $Y/(G/H)$ and X are isomorphic as left G -spaces so that

$$(8) \quad \text{Br}_G(Y/(G/H)) \cong \text{Br}_G(X).$$

Finally, Theorem 1 implies that

$$(9) \quad \text{Br}_G(Y/(G/H)) \cong \text{Br}_{G/H}(G \backslash Y).$$

Thus, Equations (7)–(9) imply that there is an isomorphism of $\text{Br}_{G/H}(H \backslash X)$ onto $\text{Br}_G(X)$ sending (B, β) to $(\text{Ind}_{G/H}^{X \times G/H}(B, \beta)/J, \tau \otimes \text{id})$ with

$$J = \{ f \in \text{Ind}_{G/H}^{X \times G/H}(B, \beta) : f(x, rH)(Hr^{-1} \cdot x) = 0 \text{ for all } x \in X \}.$$

Define $\Phi : \text{Ind}_{G/H}^{X \times G/H}(B, \beta) \rightarrow C_0(X, B)$ by $\Phi(f)(x) = f(x, H)$. Then Φ is onto (see, for example, the first sentence of the proof of [13, Lemma 2.6]). Since

$$\begin{aligned} \Phi(\tau_s \otimes \text{id}(f))(x) &= \tau_s \otimes \text{id}(f)(x, H) = f(s^{-1} \cdot x, s^{-1}H) = \beta_{sH}(f(s^{-1} \cdot x, H)) \\ &= \tau_s \otimes \beta_{sH}(\Phi(f))(x), \end{aligned}$$

Φ is equivariant, and it only remains to show that Φ induces a bijection of the quotient by J with the quotient of $C_0(X, B)$ by the balancing ideal I .

However, if $\Phi(f) \in I$, then $f(x, H)(H \cdot x) = 0$ for all $x \in X$. But then $f(x, rH)(Hr^{-1} \cdot x) = \beta_{rH}^{-1}(f(x, H))(Hr^{-1} \cdot x)$, which is zero since β covers the G/H -action on X , and $f \in J$. The argument reverses, so $\Phi(J) = I$, and the result follows. \square
